

Pushing documents into our GitHub repository:

rm -rf .git/ removes the memory or sth

* **git init**

* **git add "file name"**

or: **git add .** if we want the entire content of our folder to be added

* **git status**

* **git remote add origin https://repository.remote.url** this is where we want the data to be pushed

* **git commit -m "commit message"**

* **git branch** to see whether we're in master or main

* **git branch -m master main** to rename our repository from "master" to "main"

* **git push origin main**

If error message here: "Updates were rejected because the remote contains work that you do not have locally..."

* **git pull origin main --rebase**

* **git push origin main**
